

Your energy follows you.

Follow Me Power — location-independent energy settlement

Watt The Hack 2026

THE PROBLEM

Your energy is trapped at your meter

4.3 million Australian households generate their own electricity. But every kilowatt-hour they produce is **locked to one address**.

Their solar earns value — but only at home. Their battery arbitrages — but only at home. Step off the property and that value disappears.

Every platform in the market optimises at the meter. Nobody has broken energy free from the address.

Generation here. Consumption there. No connection.

The tradie

Runs a diesel generator on the job site at \$0.50/kWh — while their home battery sits full in the garage.

The family

Drives to the coast and pays \$0.80/kWh at a fast charger — while their panels export for \$0.08.

The parent

Watches their elderly mum struggle with power bills in a unit across town — while their own roof generates more than they can use.

The value is there. The connection isn't.

2.4M+ sole traders with home solar and remote work sites. Zero platforms offer location-independent settlement.

The grid is the wire. citEther is the settlement.

Your home solar generates credits. Those credits settle against **any grid connection point in the country** through citEther's settlement layer.

Your energy account is no longer tied to your meter. It's tied to **you**.

1 account

EVERY LOCATION. EVERY ASSET. EVERY DESTINATION.

You power her flat from your roof.

She lives in a unit across town — no solar, can't afford a battery. Your rooftop generation offsets her bill through citEther.

- A tradie's compressors run on home solar credits. No diesel.
- An EV road trip charges offset by home solar. Net cost: near zero.
- A nurse parks at the hospital for 12 hours. The car supplies the constrained node. Earns **\$40–60** while they work.

Every example is real demand. No Australian platform serves it.

Use it. Share it. Donate it. Sell it.

Your choice, not your retailer's:

- **Use it** — power your job site, EV, second property
- **Share it** — offset your mum's bill, your kid's apartment at uni
- **Donate it** — gift surplus to a local food bank or community centre
- **Sell to local business** — businesses bid on community energy
- **Sell to your Pod** — your street's local energy cooperative
- **Sell to the grid** — wholesale market, last resort

The feed-in tariff becomes irrelevant. You always have a better option.

Set it. Forget it. Every smart asset orchestrated.

Auto-Arb Engine

- Battery, HVAC, hot water, EV, pool pump
- Brand-agnostic: Fronius, Enphase, Tesla, GoodWe, Sigenenergy
- Comfort guardrails — one hot day can't erase a year's savings

Your street as a local energy cooperative. Can't afford a home battery? Buy a share in the community battery.

Set-and-forget arbitrage controller. Charges when power is cheap, discharges when valuable. Pre-cools before a price spike. Never sacrifices comfort.

citEther Pods

- Social norming: "Your street averaged \$38/month. You earned \$52."
- Same behavioural science behind the Opower trials
- Local energy stays local — lower network charges

The grid pays. You earn. citEther takes a margin on value created.

How it works

When energy travels from your roof to your mum's flat, there are transmission and distribution charges — real third-party network fees. citEther accounts for these. The consumer sees net value after costs.

Even after network fees, Follow Me Power **still pays better than a zero-cent feed-in tariff** — because the alternative is exporting for nothing.

Revenue:

- **Consumer margin** — citEther takes a share of the delta between buy-low and sell-high
- **DNSP capacity payments** — each kW of managed load is a transformer upgrade deferred
- **Grid services** — frequency response, demand⁸ management, coordinated curtailment

One suburb. One hundred households. Three months.

We built the intelligence layer at this hackathon. Live NEM data ingestion, real-time price signals, grid inertia tracking, demand response engine. The arbitrage brain and the settlement infrastructure are working.

No one else in this market is doing location-independent consumer settlement.
