

citEther

Your energy. Your value. Your community.

What the Hack · June 2026

Zero Market Power

4.3M

SOLAR HOUSEHOLDS — 450K WITH BATTERIES

The largest generation fleet in the NEM.

They invested their own capital.

They have zero market power.

You Can't Coordinate What You Can't See

Every manufacturer runs a proprietary stack.

Every retailer has a walled garden.

Nobody can see behind the meter.

7 TWh

CLEAN ENERGY CURTAILED IN 2025

Not a technology problem. A **trust** problem.

Connect. See Value. Get Paid.

citEther steps outside the proprietary loop.

Direct-to-endpoint — SunRay, Enphase, Tesla, GoodWe.

- 1. Connect** — citEther reads your inverter and battery directly
- 2. See** — real-time wholesale price, grid stress, your flexibility worth *right now*
- 3. Earn** — optimised dispatch, you keep the margin

Always net positive for the consumer.

HEADLINE INNOVATION

Follow Me Power

Your EV earns money **wherever you plug in.**

\$50

PARK AT DANDENONG

Real-time locational value across the network.

Mobile V2G with transparent settlement.

\$80

DRIVE TO SPRINGVALE — TIGHTER CONSTRAINT

Community, Not Just Coordination

Coordination without community is just another dispatch system.

—**Neighbourhood leaderboards** — your street responds collectively

—**Grid events** — shared rewards for coordinated action

—**Local meetups** — grassroots participation, the little guy banding together

Gamification drives engagement. Community drives retention.

Trust is rebuilt through transparency and belonging.

Economics

Who Pays

Grid operators — coordinated DER is cheaper than building gas peakers.

DNSPs — every kilowatt of flexible load is a transformer upgrade deferred.

Who Earns

The consumer. Always.

citEther takes a margin on the delta between grid payment and consumer passthrough.

\$0

CONSUMER COST — THEY EARN, NEVER PAY

Built at This Hackathon

The grid intelligence layer is working.

- Live NEM data** — real-time price signals across Victorian regions
- Grid inertia proxy** — synchronous generation fraction monitoring
- Interconnector flows** — five Victorian corridors tracked live
- Demand response** — event detection and response measurement

The grid-reading infrastructure is working.

One Suburb

One hundred households. Three months.

A **distribution network partner** to validate locational value against real network constraints.

A **community pilot** — prove the coordination model works behind the meter, with real people, earning real value.

citEther · intelligence for the grid
